INTRODUCTION TO V-BELTS

Megadyne V-belts have been used for decades in the most different industries and applications, offering drive solutions to customers all over the world.

Applied technology guarantees dimensional precision in V-belts allowing them to be suitable for multiple transmissions. This dimensional stability continues also during belt use.

The variety of belt sizes available allows the application of Megadyne V-belts on a wide range of drive applications, such as:

- Machine tools
- Industrial washing machines
- Textile machines
- Continuous paper machines
- High-power mills
- Stone crushers

The main V-belt components are:

- 1. Belt body** made of a special rubber compound which provides, thanks to its excellent mechanical characteristics, high-transmission efficiency and assures a minimum rubber wear off;
- 2. Tensile member** consisting of high-strength and low-stretch cords, which grant length stability over the belt lifetime;
- 3. Fabric** jacket or cover made of fabric, protecting the tensile member and permitting the use of backside idler. Our wide range of products with different power rates and several structures allows Megadyne to always find the best solution for a very wide spectrum of applications.

MECHANICAL AND CHEMICAL FEATURES

- Smooth starting and running
- Wide range of driven speed
- Low maintenance
- High efficiency
- Extremely wide horsepower ranges
- Dampen vibration between driver and driven pulleys
- Silent operations
- Long life service
- Easy installation
- Reduction in drive dimension
- Working temperature range from -30°C to +80/90°C (see details in family pages)
- Oil and heat resistance
- Antistatic properties

MEGAMATCH **MEGA MATCH**

All V-belts carrying the MEGA MATCH logo are made, and supplied, according to the matching set tolerances and limits indicated by the relevant international standards (ISO 4184, ARPM, etc).

INTRODUCTION TO V-BELTS

WRAPPED V-BELTS

EXTRA

Extra belts were designed to offer durable and reliable performances on light and medium-duty drives. They represent an affordable solution for transmission systems of all industrial sectors.

OLEOSTATIC

Oleostatic rubber belts are developed with high-resistant tensile elements, they are characterised by high performance, length stability during the life of the belts, conductivity, oil, and heat resistance. They are particularly suitable for centrifugal pumps, compressors, tool machines, generators, high-power mills, and stone mills.

OLEOSTATIC GOLD

Different materials and design features, together with an improved production process, have led to the development of a complete range of higher rated wrapped V-belts. The Oleostatic Gold V-belts products family can operate in a wide range of industrial applications, within a large spread of load capacities and speeds — offering rated performance from 100 to 8,000 RPM and power capability from 1 to 400 kW, meanwhile granting large cost advantages for the end-users.

Oleostatic Gold structure:

1. FABRIC: Double cover ply - CR Dip.

A reinforced double-fabric cover is plied around the belt to protect it against contamination and moisture. Its increased flexibility allows the belt to bend more easily around the smallest pulleys with far less strain on the fabric, while assuring a smoother running drive.

2. TOP CUSHION: SBR compound + Fibers

3. TENSILE CORD: H.T. Polyester

The tensile section is made up of a multiple number of high-strength, low-elongation polyester cords, completely embedded in the adhesion layers, to enhance resistance to tension and flex fatigue. Each cord is individually and specially coated to secure a long-lasting bond with the surrounding rubber and to grant a longer operational lifetime. In addition, the belt requires significantly less retensioning and take-up thanks to its cord's consistent length stability. A longer life of the belt means less frequent replacement, less downtime, and lower maintenance costs.

4. BOTTOM CUSHION: SBR compound + Fibers

5. BODY COMPOUND: Polychloroprene (CR) based

INTRODUCTION TO V-BELTS

RAW EDGE V-BELTS

LINEA X

These belts have been specifically developed to run where small pulleys diameters and high-transmission ratios put a limit to the use of wrapped belts of the same section.

Compared to wrapped belts, the Linea X family offers important improvements, like specific compounds and special production technology. In particular, the transverse orientation of the fibers improves the cord's support capacity of the body section and reinforces its transverse rigidity, while maintaining, (thanks to the cogged profile and the precision-ground sidewalls) the highest longitudinal flexibility and running stability. These characteristics guarantee an excellent structure with advantages such as: high-transmission ratios, improved grip, and resistance to continuous bending.

LINEA GOLD

Selected materials, advanced design features, and an innovative production process has led Megadyne to develop a complete range of raw edge V-belt drives that outperform, in a wide range of industrial applications, all the previous drives equipped with standard raw edge belts, granting large cost advantages for the end-users and greater design flexibility for the engineers. The belt has a narrow cross section and a raw edge construction, based on EPDM rubber compound which can withstand chemically aggressive environments, ageing, ozone, UV, and heat.

Linea Gold structure:

- 1. BACKSIDE FABRIC:** The textile fabric is plied on the belt backside to protect it against contamination and moisture. Its flexibility gives the belt excellent reversed bending properties, when backside idlers are used, and protects the belt against wear.
- 2. ADHESION LAYERS:** The high-performing, coloured, EPDM compound located immediately above and below the belt cords, guarantees the best possible bonding with the under cord body material.
- 3. TENSILE CORD:** The tensile section is made up of a multiple number of high-strength, low-elongation polyester tensile cords which are completely embedded in the adhesion layers and vulcanized as one solid unit to enhance resistance to tensile and flex-fatigue forces. On request, for special extreme requirements, aramid or glass fibre cords are also available.
- 4. BODY COMPOUND:** The EPDM compound, with high-performance fibers embodied in the rubber matrix, provides superior abrasion and wear resistance to the belt. The transversal orientation of the fibers improves the cord support capacity of the body section and reinforces its transversal rigidity, while maintaining, in connection with the cogged profile and the precision-ground sidewalls, the utmost longitudinal flexibility and running stability.

TECHNICAL CALCULATION

SYMBOL	UNIT	DEFINITION
C_f		correction factor C_f
C_L		correction factor C_L
C_c		correction factor C_c
d	mm	pitch diameter of smaller pulley
D	mm	pitch diameter of bigger pulley
I	mm	theoretical center distance
I_e	mm	effective center distance
i		transmission ratio
L'	mm	calculated pitch length
L_e	mm	external length ($L_p + \Delta_e$)
L_i	mm	internal length ($L_p - \Delta_i$)
L_p	mm	pitch length (effective)
n_1	RPM	speed of smaller pulley (faster)
n_2	RPM	speed of bigger pulley (slower)
P	kW	power to be transmitted
P_a	kW	actual power of the transmission
P_b	kW	basic performance of a single belt
P_c	kW	corrected power
P_d	kW	difference to P_b due to $K \neq 1$
Q		number of belts
T_s	N	static belt tension
v	m/s	peripheral belt speed
γ	°	arc of contact

TECHNICAL CALCULATION

BELT SECTION

Necessary data for selection of the belt section:

P	power to be transmitted in kW
n₁	speed in RPM of the smaller pulley
n₂	speed in RPM of the bigger pulley

It is necessary to correct the power P by a coefficient C_c (see table 1 on page 6) which takes into account the actual operating conditions.

Corrected power P_c is given by:

$$P_c = P \cdot C_c$$

The graphs give a guiding criterion for the section of the belt.

TRANSMISSION RATIO

Transmission ratio is calculated as follows:

$$i = \frac{n_1}{n_2} = \frac{D}{d}$$

where D is the pitch diameter of the larger pulley and d is the pitch diameter of the smaller pulley.

The peripheral speed of the belts is determined by

$$v = \frac{d \cdot n_1}{19100}$$

If the drive being calculated is of the V/flat type (one V pulley and one flat pulley) it is necessary to find the corresponding pitch diameter of the flat pulley.

The pitch diameter of the flat-faced pulley is obtained by increasing its external diameter by the amount in millimetres shown in the following table:

Z	A	B	C	D	E	19	20	25
8	10	14	20	24	33	16	15	19

TECHNICAL CALCULATION

PITCH LENGTH OF THE BELT AND CORRECT CENTER DISTANCE

Whenever the shaft center distance l is not predetermined by the layout of the drive, the optimum distance may be chosen as follows:

$1 < i < 3$	$l \geq \frac{(i+1) \cdot d}{2} + d$
$i > 3$	$l \geq D$

The pitch length is determined by:

$$L' \approx 2 \cdot l + 1,57 \cdot (D+d) + \frac{(D-d)^2}{4l}$$

From the list of belt sizes, should be selected the belt pitch length L_p nearest to the value of L' above calculated.

Since $L' \neq L_p$ the center distance " l " may be varied by subtracting half $L' - L_p$. Therefore, the effective center distance of the drive will be:

$$l_e = l - \frac{(L' - L_p)}{2}$$

NUMBER OF BELTS

The basic performance P_b is the power that a single belt transmits under the following conditions:

$$i = 1$$

This configuration corresponds to 180° arc of a contact belt on both pulleys;

$$i \neq 1$$

The difference of kW-rating P_d is the power that the belt transmits in excess of P_b because $i \neq 1$ in service conditions.

The actual kW-rating P_a is the power that the belt transmits in operating conditions and is obtained by means of:

$$P_a = (P_b + P_d) \times C_g \times C_L$$

Table 4 (see belt family pages) gives the values of P_b according to RPM and d (smaller diameter) and the values of P_d according to RPM and i .

TECHNICAL CALCULATION

Table 2 (bottom of this page) and 3 (see belt family pages) give values of the coefficients C_γ and C_L taking into account the operating conditions.

The arc of contact γ of the belt on the smaller pulley is determined by:

$$\gamma = 180^\circ - 57 \cdot \frac{D-d}{l_e}$$

The number of belts Q necessary for the transmission of the power P_c is determined by:

$$Q = \frac{P_c}{P_a}$$

The number of belts is actually obtained in general by rounding up Q to the next highest whole number.

TABLE 1 - TYPE OF MOTOR

Applications	Daily operating hours					
	0-8 ⁽¹⁾	8-16 ⁽¹⁾	16-24 ⁽¹⁾	0-8 ⁽²⁾	8-16 ⁽²⁾	16-24 ⁽²⁾
Light use

CLASSICAL RAW EDGE V-BELTS

NARROW RAW EDGE V-BELTS DIN

EXAMPLE

$P = 22 \text{ kW}$

$n_1 = 1200 \text{ RPM}$

$n_2 = 660 \text{ RPM}$

Textile machine operating time:
12 hours a day

Type of motor:
ac electric motor, normal torque

Correction coefficient:
1,3 (see table 1)

Corrected power:
 $P_c = 22 \cdot 1,3 = 28,6 \text{ kW}$

CALCULATION EXAMPLE

BELT SELECTION

From selection charts, for $P_c = 28,6$ and $n_1 = 1200 \text{ RPM}$ it is appropriate to choose section B.

TRANSMISSION RATIO

The transmission ratio can be calculated as follows:

$$i = \frac{n_1}{n_2} = \frac{1200}{660} = 1,82$$

Considering diameter $d = 250 \text{ mm}$ for the smaller pulley, the pitch diameter of the larger pulley is:

$$D = i \cdot d = 1,82 \cdot 250 = 455 \text{ mm}$$

The peripheral speed of the belts is determined by

$$v = \frac{d \cdot n_1}{19100} \quad v = \frac{0,052 \cdot 250 \cdot 1200}{19100} = 15,7 \text{ m/s}$$

BELT PITCH LENGTH AND CORRECT CENTER DISTANCE

For $i = 1,82$ (i.e. $1 < i < 3$) the center distance is given by:

$$l \geq \frac{(i+1) \cdot d}{4} + d \quad \text{so} \quad l = 610 \text{ mm}$$

The pitch length of the belt is determined by:

$$L' = 2 \cdot l + 1,57 \cdot (D+d) + \frac{(D-d)^2}{4 \cdot l}$$

$$L' = 2 \cdot 610 + 1,57 \cdot (455+250) + \frac{(455-250)^2}{4 \cdot 610} = 2344 \text{ mm}$$

From the list of belt sizes (see table on belt family pages), should be selected the belt pitch length L_p nearest to the value of L' previously calculated.

The center distance "l" may be varied by subtracting half $L' - L_p$. Therefore, the effective centre distance of the drive will be:

$$l_e = l - \frac{L' - L_p}{2}$$

CALCULATION EXAMPLE

Having selected **Oleostatic Gold B 91** ($L_p = 2355$ mm), the actual shaft center distance is calculated by:

$$l_e = 610 - \frac{2344-2355}{2} = 615,5 \text{ mm}$$

From table 4 of B section ($d=250$ mm; 1200 RPM; $K=1,82$):

$$P_b = 11,57 \text{ kW}$$

$$P_d = 0,48 \text{ kW}$$

The arc of contact γ of the belt on the smaller pulley is determined by:

$$\gamma = 180^\circ - 57 \cdot \frac{D-d}{l_e} = 180^\circ - 57 \cdot \frac{455-250}{616} \cong 161^\circ$$

From table 2 for $\gamma = 161^\circ$

$$C_\gamma = 0,95$$

From table 3, on page 19 for Oleostatic Gold B 91 belt

$$C_L = 1,00$$

Therefore:

$$P_a = (11,57 + 0,48) \cdot 0,95 \cdot 1,00 = 11,45 \text{ kW}$$

The number of belts Q necessary for transmission of the power P_c is established by:

$$Q = \frac{P_c}{P_a} = \frac{28,6}{11,45} = 2,5$$

Round up to 3 belts **Oleostatic Gold B 91**.

CALCULATION EXAMPLE

BELT TENSIONING RECOMMENDATION

The correct belt assembling tension is given by:

$$T_s = 500 \cdot \frac{2,5 - C_\alpha}{C_\alpha} \cdot \frac{P_c}{Q \cdot v} + m \cdot v^2$$

SYMBOL	UNIT	DEFINITION
C_α		arc correction factor
m	kg/m	belt linear mass (see belt family page)
P_c	kW	corrected power
Q		number of belts
T_s	N/strand	static belt tension
v	m/s	peripheral belt speed
α	°	arc of contact

Arc correction factor:

α [°]	180	174	169	163	157	151	145	139	133	127	120	113	106	99	91	83
C_α	1,00	0,98	0,97	0,96	0,94	0,93	0,91	0,89	0,87	0,85	0,82	0,80	0,77	0,73	0,70	0,65

LENGTH MEASURING

AND GROOVE PULLEYS

BELT LENGTH MEASURING

The first and easiest way to measure the V-belt's length is by placing the belt on a flat surface, giving the belt a circular shape, and finally measuring the internal length L_i by means of a measuring tape. Adding Δ_i and after Δ_e (see belt families pages) to this length, it's possible to calculate respectively L_p and L_e .

This measurement way is not very precise, even if practically easy and feasible with only a tape.

The correct way to measure the V-belt's length is by means of pulleys and dynamometers.

The belt is put on 2 pulleys, specific for the family and size of the belt, and having the same pitch diameter. One is fixed while the second one can move on a linear graduated scale.

Depending on the belt, a certain force is applied to the second pulley in order to put the complete system under tension. The correct force is tabled by the relevant standards referring to the belt family.

To stabilize the system, at least 3 rotations of the pulleys are required.

The pitch length L_p is given by the pulley's pitch diameter D and center distance a in the formula:

$$L_p = 2 a \cdot \pi D$$

Subtracting Δ_i and adding Δ_e (see belt families pages) it's possible to calculate respectively L_i and L_e .

GROOVE PULLEYS

Groove pulleys for V-belts must be manufactured with care and made of a good quality steel or engineering cast iron. It is most important that the flanks of the grooves shall be perfectly smooth and show no visible sign of machining, that all sharp corners of the grooves shall be rounded off and chamfered, and that the external diameter of the face shall be constant overall.

All pulleys must also be statically balanced. Dynamic balancing is required for speeds over 30 m/second.

Profile and dimension of the pulley should be in accordance with DIN 2211, BS 3790, ISO, and RMA depending on the belt's relevant standard.

LENGTH MEASURING AND GROOVE PULLEYS

- l_p = pitch width
- k = minimum height of groove above the pitch line
- h = minimum depth of groove below the pitch line
- α = groove angle
- d = pitch diameter
- e = distance between the axes of the sections of two grooves
- f = distance between the axis of the section of the outer groove and the rim of the pulley

In the drawing are shown the main characteristics and dimensions of the groove pulleys for V-belts (example referring to Oleostatic belts).

The use of idlers in V-belt drives is not recommended.

However, due to particular drive requirements and limitations, the use of idlers may be absolutely necessary.

For using idlers, the requirements are as follows:

1. Providing take-up for fixed center drives.
2. Turning corners (as in mule pulley drives).
3. Breaking up long spans where belt whip may be a problem.
4. Maintaining tension when the idler is spring-loaded or weighted.

A power correction (see below) is required.

RECOMMENDED

NOT RECOMMENDED

OUTSIDE IDLER

1. An outside idler should be at least one and one-third times as large as the smallest pulley on the drive, unless the drive has unusually large pulleys.
2. An outside idler must be flat and without any crown.
3. To find the face width of a flat idler (between flanges if flanged) add 1 1/2 times the nominal belt top width to the face width of the grooved pulley used.
4. An outside idler pulley should be located as close as possible to the preceding pulley. This is because the V-belts slightly move back and forth on a flat pulley; locating it far away from the next pulley minimizes the possibility of the belt of entering that pulley in a misaligned condition.
5. Idler pulleys should be located only on the slack side of a drive.

LENGTH MEASURING

AND GROOVE PULLEYS

RECOMMENDED

NOT RECOMMENDED

INSIDE IDLER

1. An inside idler will decrease the arc of contact.
2. An inside idler should be at least as large as the smallest pulley on the drive, unless the drive has unusually large pulleys.
3. An inside idler should better be a grooved pulley. In alternative, flat pulleys can be used.
4. A grooved inside idler pulley may be located anywhere along the span, preferably so that it gives nearly equal arcs of contact on the two adjacent pulleys.
5. Idler pulleys should be located only on the slack side of a drive.

RATED POWER CORRECTION

Because idlers impose an additional bending stress point on the V-belt, the transmittable power is reduced.

The smaller the idler diameter, the greater the bending stress, which results in a greater reduction in rated power and belt life.

To compensate for this loss, the design power of the drive must be increased.

The following table gives the approximate correction factors according to the number of pulleys in the drive.

The normal power rating should be multiplied by this factor.

N°. of pulleys in the drive	2	3 (one idler)	4 (two idlers)
Rating Correction Factor	1,00	0,90	0,80

Note: As stated, the above listed factors are only approximate values and apply only when idler diameters and their location are in accordance with the above recommendations.

STORAGE MAINTENANCE

AND USEFUL ADVICES

HOW TO STORE BELTS

In order to store the V-Belts correctly, it is advisable to hang them on “saddles” or on large-diameter tubular brackets. This diameter should be at least ten times the height of the belts’ cross section.

Long belts can be stacked to save space, provided that they are correctly coiled (see figures).

Short belts can be stored on shelves but be aware that stacks should not be more than 300 mm high as the bottom belts may be otherwise deformed.

Finally, hooks and nails are unsuitable for suspending the belts.

STORAGE MAINTENANCE

AND USEFUL ADVICES

CONDITIONS OF STORAGE

Rubber V-belts can be stored for several years without causing any performance or reliability loss.

For correct storage, some prescription must be taken into account.

ENVIRONMENT

The storage premises should be cool, dry, and well ventilated but not draughty.

TEMPERATURE

Storage temperatures should be within +5 and +30°C.

Lower temperatures cause stiffening in the belt but are accepted in the storage. In order to avoid damages in the start-up, it becomes necessary to heat the belt up to around 20° before making it run on the machine.

Higher temperatures due to heating are to be avoided. The distance from heating sources should be at least 1 meter.

LIGHT

Belts should be protected from light, especially direct sunlight and artificial light, with high ultraviolet rays (neon light).

OZONE

Equipment generating ozone, like high-voltage electrical machines or fluorescent light sources, should not be installed in the storage.

Also, combustion gases and vapours, that can cause ozone, should be avoided.

CHEMICALS

Flammable materials, lubricants, acids, and any other aggressive material should not be kept in the storage. Belts elastomers may be affected, or even irreparably damaged, by such agents.

CLEANING

Never clean the V-belts. If you need, for any reason, to clean the belts use a dry towel or one soaked with a glycerine/alcohol mixture in the ratio 1:10. Other solvents such as petrol or benzene must not be used.

Sharp-edged objects must not be used for cleaning the V-belts.

BELT INSTALLATION

To ensure a long service-life and high-performance, it is important to correctly design the application and to take care of the correct installation, maintenance, and storage of the belt.

A drive must be designed in such a way to make proper provision for both installation and tensioning of the V-belts.

For this purpose, a take-up device is necessary; a slide adjuster on the motor is recommended to simplify installation and permit optimum tensioning.

Table 5 (see belt family pages) provides the minimum variation of center distance permitted for the installation and the tensioning of the belts.

Furthermore, the following rules must always be observed:

- 1.** Check the alignment of the drive pulleys;
- 2.** Make sure that the flanks of the grooves are clean;
- 3.** Adjust the tensioner to stretch the belts sufficiently;
- 4.** Check the tension (see following section);
- 5.** Check the correct diameter for tensioning pulley;
- 6.** Protect the belts from oil and other chemicals;
- 7.** When installing belts, slack off the tensioner and avoid using tools or implements which may damage the belts.

Pulleys with large diameters increase the life of the belt. They must be statically balanced up to the speed of 30 m/s and dynamically balanced over this value.

x = Take up allowance
y = Installation allowance
l = Center distance

BELT INSTALLATION

TENSIONING SYSTEM

The satisfactory performance of a transmission equipped with V-belts depends on the correct fitting tension.

It is therefore necessary to proceed in the following way, using the slide adjuster:

BELT TENSION CONTROL BY DEFLECTION METHOD

The approximate relation among deflection force, belt deflection and belt tension is given by:

$$T_s \approx \frac{f \cdot t}{4 \cdot f}$$

Imposing a belt deflection:

$$f = \frac{t}{64}$$

The deflection force should be in the range:

$$F_{\min} \approx F' = \frac{T_s}{16}$$

$$F_{\max} \approx F'' = \frac{1,5 \cdot T_s}{16}$$

where:

SYMBOL	UNIT	DEFINITION
F	N	perpendicular deflection force
f	mm	belt deflection
t	mm	free span length
T_s	N/strand	static belt tension (see page 9)

BELT TENSION CONTROL BY VIBRATION METHOD

Belt vibration frequency:

$$F_r = \frac{T_s}{4 \cdot m \cdot t^2}$$

SYMBOL	UNIT	DEFINITION
F_r	Hz	natural frequency of belt
m	kg/m	specific belt mass
t	m	free span length
T_s	N/strand	static belt tension (see page 9)

* Belt speed is greater than 30 m/s then is necessary to use dynamically balanced pulleys. A reduction in belt life can be expected. Suggested a smaller section.

* Belt speed is greater than 30 m/s then is necessary to use dynamically balanced pulleys. A reduction in belt life can be expected. Suggested a smaller section.

* Belt speed is greater than 30 m/s then is necessary to use dynamically balanced pulleys. A reduction in belt life can be expected. Suggested a smaller section.

MEGADYNE V-BELTS

VARIABLE SPEED V-BELTS

VARISECT

VARIABLE SPEED V-BELTS

VARISECT

Varisect belts are designed for variable speed transmissions to obtain a wide range of driven speeds:

- Provides exact speed control.
- Guarantees smooth running.
- Raw edge sidewalls improve gripping action.
- Provide superior resistance to ageing caused by wear, oil, heat, grease, and harmful environmental factors.
- Static dissipating.
- Available in a wide selection of sizes.
- Guarantees a long belt life.

Materials	CR blend - polyester cord															

1. High-modulus cords

Located in the strength section to carry high HP loads with minimum belt stretch. Resists fatigue and shock. Provides excellent belt stability. Reduces the need for take-up adjustments.

2. Fabric tension section

Stretches up to 175% more than ordinary bias-cut fabric to significantly improve the belt flex life.

3. Special compound compression section

Provides uniform cord support and crosswise rigidity to lengthen belt life.

4. Raw-edge sidewalls

Improve gripping contact with pulley sidewalls. Assure less vibration. Smoother, quieter performance.

5. Precision molded cogs

Provide more surface area for heat dissipation and increase belt flexibility. Cooler operation means longer flex life.

DOUBLE ANGLE V-BELT

Ideally suited for serpentine drives where power needs to be transmitted equally from both sides of the belt. Double wrapped cotton-neoprene cover is added for excellent resistance to abrasive wear, heat, ozone, sunlight, grease, oil, or dirt.

Centrally located cord and special synthetic rubber compounds assure long belt life and a smooth and capable power capacity.

1. Double-wrapped neoprene and cotton fabric
2. The core of the belt is made of a special blend of compounds to provide a long life and a superior power capacity

BELTS CHARACTERISTICS

SECTION	38	48	58
a (mm)	9,5	12,7	15,9
s (mm)	5,5	7,2	9
weight (gr/m)	57	95	143
Working temperature	-20°C / +80°C		
Relevant antistatic standard	ISO 1813		
Materials	CR blend - aramid cord - cotton/polyester fabric		

XDV2 series belts are designed for maintenance-free operation in applications with exceptional hard working conditions.

BELT FEATURES

- Trouble-free operation on the drives with small pulleys.
- Smooth power transmission due to the belts capacity to absorb power shock.
- Ideal for drives with power oscillations.
- Thanks to the high-grade of its materials the belt gives even better results when used with back-side idlers.
- Made with a strong cotton cover for long-lasting clutching transmissions.
- Low tolerances reduce drive vibrations and allow its use in single or multiple drive transmissions without any restrictions.
- Superior resistance to temperature, oil, and weather.
- Easily identified by its light grey coloured fabric.
- Comes in popular sizes (3/8", 1/2", 5/8").
- Meets requirements for static conductivity.

XDV2 BELT DRIVES

The XDV2 belt has been created for drives that include small pulley diameters and high-temperature peaks, combined with a high-grade of moisture and humidity.

It withstands the harshest environmental requirements, such as oil and grease contaminated drives or transmissions where grits may interfere between the pulleys and the belt.

Thanks to its characteristics, the XDV2 perfectly matches the requirements of clutching drives as the aramid cord protects the belt against shock loads, all while maintaining its length constant.

XDV2 belts are used successfully in applications such as:

- Lawn movers
- Garden tillers
- Snow blowers
- Garden tractors

MEGADYNE V-BELTS

BANDED V-BELTS

PLURIBAND

BANDED V-BELTS

PLURIBAND

Pluriband are special belts capable of transmitting very high loads. The structure is made to be equivalent in performance to several corresponding V-belts: a Pluriband A47-1200-5 has the same performance as 5 A47 belts working in parallel. The procedure for engineering a system using Pluriband belts is the same as described in the technical calculation chapter, using the same performance data as the corresponding V-belt profile.

USEFUL FORMULAS

AND CONVERSION TABLE

SPEED		
$V = \frac{d_1 \cdot n_1}{19100}$	$n_1 = \frac{V \cdot 19100}{d_1}$	$d_1 = \frac{V \cdot 19100}{n_1}$

V: peripheral speed [m/s] | **n1:** rotation speed [RPM] | **d1:** pulley diameter [mm]

FORCES AND TORQUE		
$F_u = \frac{19,1 \cdot 10^6 \cdot P}{d_1 \cdot n_1}$	$F_u = \frac{2000 \cdot M}{d_1}$	$F_u = \frac{P \cdot 10^3}{d_1}$
$M_t = \frac{P \cdot 9550}{n_1}$	$M_t = \frac{F_u \cdot d_1}{2000}$	$M_t = \frac{P \cdot d_1}{2 \cdot V}$

Fu: peripheral force [N] | **Mt:** drive torque [Nm] | **P:** power [kW]
n1: rotation speed [RPM] | **d1:** pulley diameter [mm] | **V:** peripheral speed [m/s]

SPEED		
$P = \frac{F_u \cdot d_1 \cdot n_1}{19,1 \cdot 10^6}$	$P = \frac{M_t \cdot n_1}{9550}$	$P = \frac{F_u \cdot V}{1000}$

P: power [kW] | **Fu:** peripheral force [N] | **Mt:** drive torque [Nm]
n1: rotation speed [RPM] | **d1:** pulley diameter [mm]

DATA SHEET

CUSTOMER DATA

Company Name _____ Date _____

Address _____ Zip Code _____

City _____ State _____ Country _____

Customer Name/Surname _____

Office _____ Tel. _____ e-mail _____

Application field _____ ☐ New ☐ Existing*

Volume _____

**Please enclose to this request all the details of the existing application (competitor's belt, current data, etc..)*

TRANSMISSION LAYOUT

☐ Power transmission

☐ Other (If layout is different please sketch it above)

DRIVE INFORMATION

☐ AC ☐ DC ☐ Soft Start ☐ Inverter

Power _____ Speed _____

Torque _____ Acceleration _____

Working time ☐ < 8h ☐ From 8h up to 16h ☐ 24h

Driver pulley's diameter _____ Driven pulley's diameter _____

Center distance _____ Minimum safety factor needed _____

Are there any size limitation? ☐ Yes ☐ No

(if yes, please indicate *Max and/or Min diameter, Max and/or Min width and Max and/or Min center distance*):

Min diameter _____ Min width _____ Min center distance _____

Max diameter _____ Max width _____ Max center distance _____

The data and information contained in the present catalogue are updated to the date of the catalogue's printing. Ammega Italia S.p.A. reserves the right to modify the specifications, performances and other information relating to the belts described in the present catalogue, at any time at its own discretion, without any prior notice.

For updating refer to our website www.megadynegroup.com.

Technical specifications, performances and other information provided in the present catalogue are indicative and do not bound Ammega Italia S.p.A. unless such specifications, performances or other information are expressly agreed in the agreement with the customer.

We also recommend to read carefully the following documents on our web site www.megadynegroup.com:

- Ammega Italia S.p.A. General Conditions of Sale (comprising the warranty)
- Theoretical Belt Life.
- Drive Components: Storage, Installation, Maintenance and Troubleshooting Handbook
- Belts standard use condition and temperature.
